

Progress in Parkinsons Disease Research 2 (v. 2)

There has been a surge of progress made in recent years in Parkinsons research. The cloning of receptors for dopamine has been realized, and significant advances have been made in understanding the molecular nature of the interaction between dopamine and mediation of its actions in the brain. In addition, the mechanisms of action of MPTP, a toxin producing parkinsonism in humans and animals, has been further elucidated and is now largely understood. With many contributions on the loss of dopaminergic neurons, the hallmark of Parkinsons disease, Progress in Parkinsons Disease Research - 2 reports on current progress with the hope of accelerating future research efforts in the field. This book brings together top scientists actively engaged in research relevant to Parkinsons disease.
